Feeding Recommendation

Beginning from day of transplant or sticking of URC: Water in with Nature's Source 10-4-3 or 10-4-5 at a rate of 300 ppm N 2-3 times per week for the first 3 weeks. Direct Inject setting of 1:400. Then, increase the rate to 400 ppm N. Direct Inject setting of 1:300.

An initial application of Plant Probiotic at a rate of ¼ lb. per 50 gallons of water is also recommended within the first week of transplant or sticking.

As buds begin to form through finished production: Reduce rate back to 300 ppm N 2-3 times per week. An additional application of Plant Probiotic at a rate of ¼ lb. per 50 gallons of water is also recommended during the growing cycle.

NOTE: When media is too wet to apply feed due to weather, apply as a foliar to maintain active plant growth.

Application of Nature's Source Foliar Essentials encourages a more compact growth habit with increased tone and density, while encouraging nutrient uptake. Apply at a rate of 1 gallon per 100 gallons of water (1 oz. per gallon). Apply every 7-10 days as needed.

Constant Feed Option: Beginning from the day of transplant, water in Nature's Source 10-4-3 or 10-4-5 at a feed rate of 300 ppm N. Reduce constant feed rate to 250 ppm. Direct Inject setting of 1:500.

Nature's Source Benefits: Nature's Source is derived from oilseed extract, providing a low salt index. Mums grown with Nature's Source will be denser, fuller with deep green foliage, and more pliable stems – not brittle as is often the case when grown with salt based synthetic fertilizers. More tone with better shipping and shelf-life quality.

Injector Ratio Chart						Tank Mix Chart		
ppm N	250 ppm	300 ppm	400 ppm	500 ppm	600 ppm		Desired ppm of N	
Injector Ratio	1:500	1:400	1:300	1:250	1:200		100	100 3.5
							300	300 7.0
							500	500 10.5
							600	600 21.0

Stock tank solutions are not recommended. When stock tank is mixed, Solution should be kept fresh and covered. To be used within 48-72 hours. Sanitize with an organic sanitizing spray on top of solution if held longer than 72 hours.

ALWAYS AGITATE THE PLANT FOOD BEFORE ADDING OT STOCK TANK ALWAYS AGITATE THE DILUTION PRIOR TO EACH USE

Nature's Source is made with oilseed extract which contains 20 plant-essential amino acids, silicon, and organic compounds (see reverse).

Note: This program assumes soil media, water source and climate control is ideal. Adjustments will also be necessary based upon a strain's growth habit and actual flower timing.

• Soil Media – Use only well drained professional soil media products with a small organic nutrient or compost component with a beginning EC under 1.5 mS/cm

• <u>Water Source</u> – Treat high alkalinity water, (above 100 ppm), with acid neutralization for a stabile water pH of 6.5. High EC water, above .5 mS/cm, will require regular EC monitoring and possible remediation through leaching and/or water treatment.

• <u>Strain Adjustment</u> – Plan to reduce or eliminate the high rates in Vegetative Stage 2 for dwarf and early flowering strains; some strains may need reduction to half the recommended rate of Nature's Source 10-4-3 or 10-4-5

Oilseed Extract: Key Organic Compounds

Includes 20 Plant Essential Amino Acids, Essential Vitamins, Hormones and Minerals*

AMINO ACIDS	Role**
Alanine	Only amino acid that can operate in anaerobic and N-limiting conditions. Helps plants deal with flood and N-limiting conditions
Arginine	Amino acid in plants that acts as an important nitrogen reserve and recycling, but also as a precursor of the biosynthesis o
	polyamines, nitric oxide and so on. Polyamines and nitric oxide are important messengers involved in almost all physiologica
	and biochemical processes, growth & development, and adaptation of plants to stress
	(http://www.ncbi.nlm.nih.gov/pubmed/17287563)
Asparagine	Affects nitrogen transport and storage efficiency
Aspartic Acid	Significantly improves nutrient acquisition by the plant through artificially increasing the volume of phosphorus fertilizer occupied
	by increasing root branching and root hair development.
	(https://docs.google.com/viewer?url=patentimages.storage.googleapis.com/pdfs/US5350735.pdf)
Cysteine	Can increase H2S production in soil. An important negative effect of H2S on plant growth is an inhibition of the energy
	dependent process of N uptake. (https://wap.aslo.org/lo/toc/vol_35/issue_2/0399.pdf)
Glutamic Acid	Fundamental metabolite in the formation of vegetable tissue and chlorophyll synthesis. Fundamental to plant growth.
Glutamine	Builds key enzyme involved in assimilating inorganic nitrogen
Glycine	Plant growth regulator to slow the maturation process of some fruit by temporarily suppressing ethylene production. Slows fruit
-	ripening in some plants.
Histidine	Supplying histidine to a non-accumulating species greatly increases both its nickel tolerance and capacity for nickel transport to
	the shoot. (http://www.nature.com/nature/journal/v379/n6566/abs/379635a0.html)
Isoleucine	Critical for protein synthesis and normal plant growth, while also providing precursors for a number of secondary metabolites
	such as; cyanogenic glycosides, glucosinolates, and acyl-sugars.
Leucine	Involved in plant defense and resistance to pathogens.
Lysine	Impacts gene expression; regulates flowering time and hormone response.
Methionine	- L-methionine is an established precursor of ethylene and its application to soil has shown positive effect on plant growth. Has
	also been shown to increase C2H4 accumulation in the soil atmosphere.
	(http://www.pakbs.org/pjbot/PDFs/41(5)/PJB41(5)2455.pdf)
Phenylalanine	Starting compound used in the flavonoid biosynthesis. Key component to antioxidant production, may improve flavors.
Proline	Protects membranes and proteins against the adverse effects of high concentrations of inorganic ions and temperature extremes
	Increases plants ability to deal with temperature stress.
Serine	Fundamental role in metabolism, linked to root development.
Threonine	Protein kinases frequently attach phosphates to Threonines in order to facilitate the signal transduction process. Helps uptake
	phosphates.
Tryptophan	Can increase IAA concentrations in soil. IAA can increase internodal elongation.
Tyrosine	
	Important role in photosynthesis, electron donor in chloroplasts
	Essential amino acid for plant growth
Valine OTHER ORGANIC COMP	Essential amino acid for plant growth OUNDS **Role
Valine OTHER ORGANIC COMP	Essential amino acid for plant growth OUNDS **Role
Valine OTHER ORGANIC COMP	Essential amino acid for plant growth
Valine OTHER ORGANIC COMP	Essential amino acid for plant growth OUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage
Valine OTHER ORGANIC COMP Vitamin C	Essential amino acid for plant growth COUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress.
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3	Essential amino acid for plant growth COUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together.
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3	Essential amino acid for plant growth CUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and OH), and prevents
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3 Alpha-Tocopherol	Essential amino acid for plant growth CUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 1O2 and OH), and prevents the propagation of lipid peroxidation, contribute to plant stress tolerance.
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3	Essential amino acid for plant growth CUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and OH), and prevents the propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed through
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3 Alpha-Tocopherol	Essential amino acid for plant growth CUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damager resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 1O2 and OH), and prevents the propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed through high salinity, pathogens such as pythium, nutrient deficiencies and toxicities. Rapidly broken down by microbes in the nutrient deficiencies and toxicities.
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3 Alpha-Tocopherol Thiamine (B1)	Essential amino acid for plant growth CUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and OH), and prevents the propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed through high salinity, pathogens such as pythium, nutrient deficiencies and toxicities. Rapidly broken down by microbes in the nutrient solution. (http://www.quickgrow.com/gardening_articles/plant_hormones.html)

B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed through high salinity, pathogens such as pythium, nutrient deficiencies and toxicities. Rapidly broken down by microbes in the nutrient solution. (http://www.quickgrow.com/gardening_articles/plant_hormones.html) Induced expression of pathogenesis-related (PR) genes in the plants, suggesting its ability to trigger a signal transductior pathway that leads to systemic resistance. (http://apsjournals.apsnet.org/doi/abs/10.1094/PHYTO.2000.90.8.801) Released from decomposing plant litter, can be transformed into insoluble and recalcitrant humic substances, form chelates with aluminum or iron ions (immobilizes metals). Can lock up heavy metals within the soil, making them immobile. Silica is the 2nd most abundant element in the soil and effectively reduces susceptibility of plants to pests (http://forww.jpep.ir/browse.php?a_id=140&slc_lang=fa&sid=1&fnst%E2%80%8E) Promotes disease and insec
Valine OTHER ORGANIC COMP Vitamin C Vitamin D3 Alpha-Tocopherol Thiamine (B1) Riboflavin (B2) Phenols Silica (SiO2) Silicon (Si) Total Phenolics Indole Acetic Acid (IAA) Protein Fat HORMONES Gibberellins (GAs)	Essential amino acid for plant growth CUNDS **Role Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and help deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and OH), and prevents the propagation of lipid peroxidation, contribute to plant stress tolerance.
